1.2.11 Platform

Start of Intermative comments

The entity that presents and receives information to and from the user. The Platform is composed of the Motherboard to which the CPU and primary peripheral devices are stacked, the CPU(s), at BIOSes, the TPW, and peripherals attached to the mem board.

Bad of halomethy, government

¹ Primary peripheral device refers to devices which directly attach to an directly interact with the CPU. Examples are PCI cards, LPC components, USB Host controller and root hub, attached serial and parallel ports, etc. Examples of devices not included in this class are USB and IEEE 1394 devices.

1.2.12 Platform Reset

Such A lader Matter entertuation.

The contract of the contract of a con

The event that causes the components of the Platform to enter their reset condition including the TPM (caused by a TPM_Init). Upon a Platform Reset, the CPU MUST begin execution at the CRTM. This event MUST cause a PCI_Reset. Unless otherwise stated, the result of a Platform Reset MUST cause the equivalent of transitioning the motherboard from the S5 state (i.e., It may not cause a transition from S3.)

End of information and angeles

1.3 Concepts

1.3.1 Immutable

In this specification immutable means that in order to maintain trust in the Platform, the replacement or modification of code or data MUST be performed by a Platform manufacturer-approved agent and method. This allows a manufacturer to establish an upgrade method for the portion of the Platform which is the CRTM with consideration of the security properties of the Platform's Protection Profile.

1.3.2 Trusted Building Block (TBB)

The combination of the CRTM, TPM, connection of the CRTM to the motherboard, and the connection of the TPM to the motherboard. The connection of the CRTM to the TPM is done through transitive trust of the CRTM connection and the TPM connection.

Since the CRTM and the TPM are the only trusted components of the Motherboard and since indication of physical presence requires a trusted mechanism to be activated by the platform owner, the indication of physical presence MUST be contained within the TBB.

1.3.3 Platform Reset Types

Semi of himmanice excurance

A Cool Broo Perform Keset account when manipulating the Philippe hom a full Poure alf state y Which up OS appellic sixte or sixtue is preserved on the Philippe accept for that which is confeduct on any OS load device to a Poure-On state. This excludes extunding from verious power or suspend <u>states which can occur shar</u> the Ods Soot Reset from an OS present state.

A Harewant Platform Resourcement of a signer activates the resourcement of al Pietform components. This may be a user indicted exact or a autovant indicted examiting of the a compand to a highway gomponent which execute the resourching.

Á Wenn. Bud Pletfinn Ressi stome vinar spilvar hoften tensod by a meerbayboerd ignit but may be sofixare industob causes a Plefienn Ressi

and of informative comments

For all types of Platform Resets the CPU SHALL begin executing code with the CRTM's Platform initialization code. The Platform MUST perform a Platform Reset. No System component SHALL block the PCI_Reset signal to any of the System components.

1.3.4 Core RTM (CRTM)

The Core Root of Trust for Measurement (CRTM) MUST be an immutable portion of the Platform's initialization code that executes upon a Platform Reset. The Platform's execution MUST begin at the CRTM upon any Platform Reset.

The trust in the Platform is based on this component. The trust in all measurements is based on the integrity of this component.

Currently, in a PC, there are at least two types of CRTM architectures:

CRTM is the BIOS Boot Block.

Seni of Informative comments

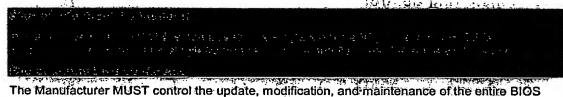

In this authiteaure the SIOS is composed of a SIOS Boot Block and a POST BIOS. Each of these ore independent components and each can be updated independent of the other. In this

 \cdot

引起,我主要介定自己的 做人的自然不完全之间,他把这个主席的主义的是否的现在分词,但不会也没有不好。 End of the many the restaurance

The Manufacturer MUST control the update, modification, and maintenance of the BIOS Boot Block component, while either the Manufacturer or a 3rd party supplier may update, modify, or maintain the POST BIOS component. If there are multiple execution points for the BIOS Boot Block, they must all be within the CRTM.

CRTM is the entire BIOS

1.3.5 Boot State Transition

The transition between Pre-Boot and Post-Boot states is the first invocation of INT 19h or equivalent.

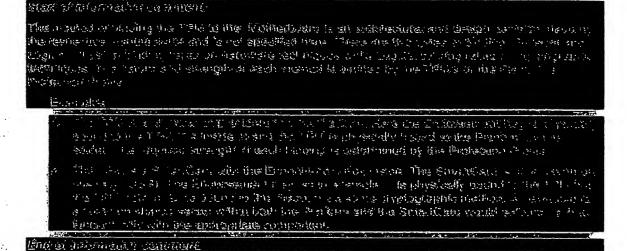

1.3.6 Establishing the Chain of Trust

1.3.6.1 **Bindings**

1.3.6.1.1 Bindings between an Endorsement Key, a TPM, and a Platform.

The relationship between the Endorsement Key, a TPM, and a Platform is described in Section 2.2 of the TCPA Main Specification.

1.3.6.1.2 Binding Methods.

2. Int grity Collection & Reporting

2.1 Concepts

2.1.1 Initial TBB control and Platform Reset

Upon Platform Reset the CRTM MUST have control of the TBB.

2.1.2 Transferring Control

Prior to transferring control an executing entity MUST measure the entity to which it will transfer control.

2.2 PCR Usage

Steppi of anknownshime Guardenia.

| 5 | IPL Code Configuration and Data (for use by the IPL code) | |
| 6 | State Transition and Wake Events | ヿ |
| 7 | Reserved for future usage. Do not use. | \neg |

2.2.1 PCR[0] - CRTM, POST BIOS and Embedded Option ROMs

Sterio of informative comments

The CRUM may measure itself to PCRM and must measure to PCRM any partien of the POST (StOS, Inducing Menulactural Control of Embadded Option ROMs, Inducing Menulactural Control of Embadded Option ROMs, Induces, etc. their are provided as part of the Methalbeard. Only exacutable code is logged. Configuration data such as ISSOD should not be measured as part of this PCR.

All these companents and any update to them are under the control of the manufacturer or its agent.

ં માના માના કરતા કરતા કરતા છે.

Entities that MUST be Measured:

* - E885 *

- The CRTM's version identifier.
- · All firmware physically bound to the motherboard
 - Manufacturer Controlled Embedded Option ROMs
 These are Embedded Option ROMs whose release and update is controlled by the Manufacturer.
 - Embedded SMM code and the code that sets it up.
- ACPI flash data prior to any modifications.
- · BIS code (excluding the BIS certificate).

Entities that MAY be Measured:

 Any other code or information that is relevant to the CRTM, POST BIOS or Platform Extensions.

Method for Measurement for a Compound BIOS:

The CRTM performs these measurements as follows:

- 1. Log the CRTM's version identifier.
- 2. Measure the code to which the CRTM is transferring control.

The POST BIOS may need to reconstruct events that could not be recorded due to the unavailability of memory. If it does so it places this information into the Event Log and MUST NOT extend PCR[0] with this reconstructed information.

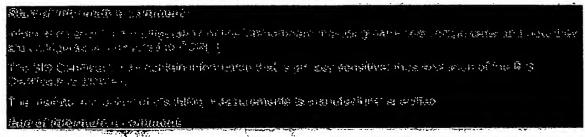

3. The remaining measurements MAY be performed in any order.

Method for Measurement for an integrated BIOS:

The CRTM performs these measurements as follows:

- 1. Log the CRTM's version identifier.
- 2. The CRTM measures the remainder of the All BIOS firmware.

2.2.2 PCR[1] - Motherboard Configuration

These measurements occur only while in the Pre-Boot state.

Entities that MUST be Measured:

The following entities MUST always be measured. These MUST NOT be disabled:

If the BIOS loads a CPU microcode update, it is measured.

 Platform Configuration including the stat of any disable flags affecting the measurement of entities into this PCR.

Entities that MAY be Measured:

The following entities MUST be measured if measurement of the following entities is enabled by the system. These MAY be Disabled:

- BIS certificate.
- POST BIOS-Based ROM strings.

Entities that MAY be Measured

While the code to implement the above entities is mandatory, the code to implement measurement of these entities is optional. It is not required to measure the components of the following that contain privacy information but if implemented, the rest of the information MUST be.

- ESCD, CMOS and other NVRAM data
- SMBIOS structures
- Passwords

Entities that MUST NOT be Measured

- Values and registers that are automatically updated (e.g., clocks).
- System unique information such as asset, serial numbers, etc.....

Method for Measurement:

The BIOS performs these measurements as follows:

 The entities specified in this PCR MAY be measured in any order deemed appropriate by the implementer. Where possible these measurements SHOULD occur prior to measuring Option ROMs.

2.2.3 PCR[2] - Option ROM Code

Stant of Informative comment

Option ROMs contained on non-Plations adaptes are unsasured by the ECOS to PORIA. There may be two portions of Cipilon ROMs: Visible and Hidden. Each is measured and logical to PORIA.

morning enemican

The pointer of the Oping RCM that is visible of the RIOS WINST or measured by the BIOS.

Hiddian Oghan ROX: Gode

Some Option ROMs may use paging or other hedrolopes to load and execute code that was not visible to the BIOS when messuring the visible portion of the Option ROM. It is the responsibility of the Option ROM to messure this code prior to executing any portion of that hidden Option ROM ands.

End of informative comment.

Any application that modifies the Option ROM code MUST measure the new code into PCR[2] or cause a Platform Reset.

Version 1.00 September 09, 2001

7

Entities to be Measured:

- The portion of the Option ROM that is visible to the BIOS.
- The portion of the Option ROM that is not visible to the BIOS is measured by the Option ROM.
- Non-Manufacturer Controlled Embedded Option ROMs

These are Embedded Option ROMs that are physically contained on the Motherboard (as opposed to an add-in card) but the release and control of any update is not controlled by the (Motherboard) Manufacturer.

Method for Measurement:

The BIOS performs these measurements as follows:

- 1. Log the event OptionROMExecute for each option ROM.
- 2. The entities specified in this PCR MAY be measured in any order deemed appropriate by the implementer.
- 3. Repeat until all Option ROMs are measured and executed.

Option ROMs perform these measurements as follows when they execute:

- 1. Measure the event "Un-hiding Option ROM Code" when un-hiding Option ROM code.
- 2. Measure the "hidden" Option ROM Code.

2.2.4 PCR[3] - Option ROM Configuration and Data

Ruser of autorities, five in admictions.

De Option ROME en ville delevir stay his vir no séquisaitor and staign asia selected to the automotion of population of any 7 appendix Option ROME quarters stay measurement.

But of a termination operations.

Any application that modifies the Option ROM configuration MUST measure the new configuration into PCR[3] or cause a Platform Reset.

Entities to be Measured:

- Configuration data specific to Option ROM or the adapter that hosts the Option ROM.
- Other data, including comments, specific to Option ROM or the adapter that hosts the Option ROM.

Method for Measurement:

The Option ROM or Application performs these measurements as follows:

- 1. Measures the event OptionROMConfig.
- 2. Measure any of the above in any order while executing.

2.2.5 PCR[4] - IPL Code

Starfied intermethre comments

W IFL code afture control back to the BIOS, each subsequent IFL mast be separately massured

Version 1.00 S ptember 09, 2001

Copyright TCPA 2001

End of Internative comment.

Entities to be M asur d:

- Each IPL that is attempted and executed.
- · Additional code that is loaded by the IPL.

Entities to Exclude:

 Portions of IPL pertaining to the specific configuration of the platform. (e.g., disk geometry in the MBR).

Method for Measurement:

See section 6.2.3 Logging of Boot Events for further detail.

The BIOS performs these steps as follows:

- 1. Measure EV_ACTION with the relevant event.
- 2. Measure the IPL Code.
- 3. If control returns to the BIOS, measure that event.
- Go to Step 1.

A complete description of the method for measuring is found in Section 6 IPL Code, Power States, and Transitions

2.2.6 PCR[5] - IPL Configuration and Data

Remoderative accounted.

The IPL Code may been configuration or other deleding is noteened to fire dusted 19 accretes of the Plethans. An exemple of this is IPL code bast ellows the estention of element burn perfects in diffe exemple. The pentition estention information would be legged to this PCF by the IPL code

Information mossumed the title PCR by the E4OS is state information ambedded white the LFL seds such as the tisk geometry within the MBR.

inentings extrauted the later

Entities to be Measured:

- All relevant IPL configuration data.
- Static data contained within the IPL Code (e.g., disk geometry)

Method for Measurement:

The IPL code measures all relevant IPL configuration data per its defined events.

The BIOS measures the static data as events defined in Section 7.2.2 Platform Specific Event Log

2.2.7 PCR[6] - State Transition

Seri of informative comment.

Events reported to this PCR are events rateful to State Transitions and Wake Events.

Bis d'otherames comment

Entities to be Measured:

- Wake Events
- All relevant State Transitions.

Method for Measurement:

Wake events are measured by the Pre-Boot components as defined in Section 7.2.2 Platform Specific Event Log

State Transitions are measured by the Post-Boot components as defined in Section 7.2.2 Platform Specific Event Log

2.2.8 PCR[7] - Reserved

Stain an administration il a displaces. Populari il suo per en 2007 et la sec Lina de negocia della estenazione il

3. Platform S tup and Configuration

3.1 Pre-Boot ROM-based Setup

Upon completion, this setup utility MUST perform a Platform Reset. This includes setup utilities provided by both the motherboard-based BIOS and Option ROMs.

Entry into this state is measured as event "Entering ROM Based Setup".

3.2 Post-Boot ROM-based Setup

Start of britanisming community. This is FOX-reased south, a present the improved britains during possible in some. And of informative community

The setup utility MUST NOT allow changes to platform configuration unless the Post-boot environment can measure the event or the setup utility provides a mechanism to notify the Post-Boot OS that a change occurred.

3.3 Reference Partition

This is treated as IPL code. The setup utility within the reference partition MUST measure events that affect platform configuration.

3.4 OS Based Setup Utility

The setup utility MUST measure events that affect platform configuration.

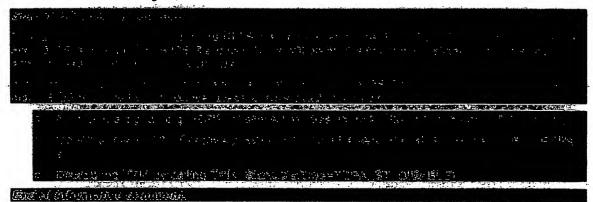

4. Maintenance

33

Implementation of Maintenance is optional. If it is implemented it MUST be implemented as defined in this section.

4.1 BIOS Recovery Mode

It MUST NOT be possible for a BIOS Recovery Mode to allow impersonation of another valid boot state. This applies to the values in the pre-Boot PCRs. Upon completion, the BIOS Recovery Code MUST cause a Platform Reset.

4.2 Flash Maintenance

Stere as lithermalikas commisers. Triste are and suspective, and lisebuliseaser happeness becomes in which is of the desit. The dasis now tights one planet of this likely which he had stable help an appear the tuknet. Bas of militarity and a comment.

4.2.1 Manufacturer Approved Environment (MAE)

Stanced intermediate economicals This is velog a chily that is appreced by the Manulacians of the Philippi That of advantage economicals

The CRTM MAY be updated while in MAE.

4.2.2 Non-Manufacturer Approved Envir nment (NMAE)

State of lighter course a secure course of the security of the Security of the Teallows Thus is easing a nature of all to the experience of the Security of the Teallows Englar and representations commissed.

The CRTM MAY NOT be updated while in NMAE.

5. TCPA Credentials

All TCPA Credentials MUST be represented as Certificates as defined in Section *9.5 Instantiation of Credentials as Certificates" in the Main TCPA Specification.

5.1 Platform Certificate

Distribution is manufacturer controlled.

5.2 Platform Conformance Certificate

Distribution is manufacturer controlled.

5.3 Method of Verification

Verification of the entity against the hash value within the Validation Certificate is not required. If performed, the hash within the Validation Certificate must include the entire Validation Certificate Header excluding the Validation Certificate itself.

5.4 Validation Certificate Header

If present, the Validation Certificate will be contained within the Option ROM header as specified below according to the "Plug and Play BIOS Specification".

| Offeet | S120 | Walua | Description |
|--------|--------|--------------|--|
| 0h | DWORD | TCPA (ASCII) | Signature |
| 04h | BYTE | 01h | Structure Revision |
| 05h | BYTE | Varies | Length (in 16 byte increments) |
| 06h | WORD | Varies | Offset of next Header (0000 if none) |
| | BYTE | Varies | Number of segments. Value of 0 indicates entire visible portion of Option ROM excluding the Validation Certificate |

Exercical expression of the first terms of the firs

Lust before handing control over to the operating system, The BIOS meets to perform several entions In order to essure that trust in the obtions for been maintained. One of the experient examb that meet to enough is the extending of PORIA, Tris is done utilizing the BIOS function WIT 1A4 where AH = BBh and AL = Oth (FreshlogExtendExent) to nest the first 512 bytes of the boot devise.

End of informative comment.

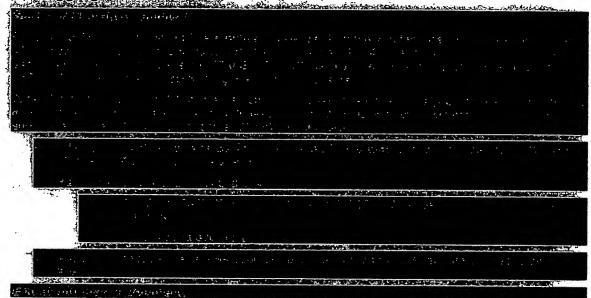

6.2.2 Extending PCR[5] - IPL Configuration and Data

Start of informative comments

PCRM Is reserved for any configuration data that vertous transition code may need. For example, if a BIOS is transitioning to a MBR on a local date, then there may be no configuration resoled. However, this PCR is to be utilized and exambed by any boot leader for variable data.

End of informative comment.

6.2.3 Logging of Boot Events

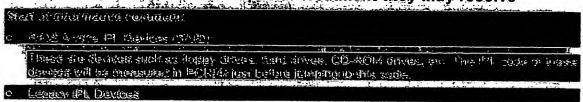

Prior to calling Int19h, the event EV_SEPARATOR SHALL be measured to the pre-boot PCRs (PCR[0-7]). This SHALL be followed by measuring the event "Calling INT 19h" to PCR[4]. If a boot device returns, an event indicating the nature of the return SHALL be measured to PCR[4]. Subsequent attempts to boot SHALL measure the boot device to PCR[4] and the event EV_SEPARATOR to the pre-boot PCRs (PCR[0-7]).

6.2.4 Passing Control of the TPM from Pre-Boot to Post-Boot

The control of t

6.3.1.1 S1: Stand-by - Low wakeup latency sleeping state

TPM State: Fully working, because the TPM is still under power during S1 sleep state.

Entering S1: Nothing to do.

During S1: Nothing to do.

Exiting S1: Nothing to do.

6.3.1.2 S2: Stand-by with CPU context lost

TPM State: Fully working, because the TPM is still under power during S2 sleep state.

Entering S2: Nothing to do.

During S2: Nothing to do.

Exiting S2: Nothing to do.

6.3.1.3 S3: Suspend To Ram

TPM State: S3 is the most complex mode to handle, because PCR values are to be preserved by

the platform during this mode. The mechanism to preserve the values cannot be accessible outside the TPM. During S3 the TPM must prohibit all TPM functions.

Entering S3: The post-boot driver MAY issue the TPM_SaveState.

During S3: May have power. This is hardware design dependent. If the TPM has the ability to

preserve the contents of the PCRs without power, no power is needed to the TPM. However, if the TPM cannot maintain the contents of the PCRs without power, the Motherboard MUST provide sufficient power to the TPM to maintain the PCRs.

Exiting S3: The command to restore the PCRs is issued by the CRTM.

6.3.1.4 S4 OS: Suspend To Disk

TPM State: All power, including auxiliary, is removed.

Entering S4: Nothing to do.

During S4: The TPM is off – Nothing to do.

Exiting S4: The PCRs will be lost, including the PCRs used by the OS, therefore the OS must

establish new integrity. The OS, therefore, cannot attest to its original power-on state.

6.3.1.5 S4 BIOS: Suspend To Disk

, Å.

ROPA Hashi Golf condition

Englis are logged using the TOPA. PAIR LEVELY sinuture as defined in the liter Specification.
These sinustries are stored as an incorporatived array ration for ACPI dark are as July at a Section 7.1 ACPI Table Usage, if one of the AR-Economities including ACPI are required in one part one dark. The situages of the case deling ACPI is a conventioned because there are defined in an a letter straight of the dark deling and this lateration places in all of the Vertical arrays of this lateration places in all or its usars of this lateration to the Post-Economic State controls the place on, the Post-Econ OS is expected to read this dark and transfer 1 to be own than the

End of intermedica common.

The instantiation of the event log is an array of TCPA_PCR_EVENT structures as defined below.

7.2.1 Platform Independent Event L g Structure

Platform independent events SHALL be done using the events identified in the TCPA Main Specification. Examples of these are Validation Certificates. These are logged using the EV_CODE_CERT event type.

7.2.2 Platform Specific Event Log

For the events described in this section the EventType SHALL be EV_PLATFORM_SPECIFIC and the event field within the TCPA_PCR_EVENT structure SHALL be the PlatformSpecificEventLogStruct as defined in Section 7.2.2.1 Platform Specific Event Log Structure.

7.2.2.1 Platform Specific Event Log Structure

The Events shall be the following structure.

```
PlatformSpecificEventLogStruct STRUCT

EventID DD ? / Tag as defined in

Section 7.2.2.2 Platform Specific Event Tags

EventDataSize DD ? / Size of EventData

EventData DB ? / EventData

PlatformSpecificEventLogStruct ENDS
```

7.2.2.2 Platform Specific Event Tags

The EventID and EventDataSize elements are represented in big endian format.

7.2.2.2.1 SMBIOS structure

Each event MAY consist of one or more complete SMBIOS records. This event may appear multiple times in the event log. The SMBIOS structure SHALL be logged using the following:

EventID = 0001h

EventData[] = One or more raw complete SMBIOS records.

7.2.2.2.2 BIS Certificate

The BIS Certificate SHALL be logged using the following:

EventID = 0002h

EventData[] = Raw BIS Certificate

7.2.2.2.3 POST BIOS ROM Strings

The BIOS ROM Strings SHALL be logged using the following:

EventID = 0003h

EventData[] = Hash of POST BIOS ROM Strings

7.2.2.2.4 ESCD

The ESCD SHALL be logged using the following:

EventID = 0004h

EventData[] = Hash of ESCD Data

7.2.2.2.5 CMOS

The CMOS SHALL be logged using the following:

EventID = 0005h

EventData[] = Raw CMOS Data

7.2.2.2.6 NVRAM

The NVRAM SHALL be logged using the following:

EventID = 0006h

EventData[] = Raw NVRAM contents

, 7.2.2.2.7 Option ROM Execute

The BIOS logs the execution of each Option ROM into PCR[2] using the following:

EventID = 0007h

EventData[] = OptionROMExecuteStructure(including the PFA)

7.2.2.2.8 Option ROM Configuration

Option ROMs log events into PCR[3] using the following:

EventID = 0008h

Event[] = OptionROMConfigStructure(include PFA)

7.2.2.2.9 Option ROM Microcode Update

Option ROMs log events into PCR[2] using the following:

EventID = 000Ah

Event[] = Hash of Microcode that will be loaded.

7.2.3 EV_ACTION Event Types

The following actions strings are defined. The strings below are enclosed in quotes for clarity; the actual log entries SHALL not include the quote characters. They SHALL be logged using the following:

EventType = EV_ACTION

Event[] = ASCII string of the following:

| String | Purpose and Comments | PCR |
|----------------------------------|---|-----|
| "Calling INT 19h" | BIOS is calling INT 19h. If no additional strings posted in log that means that the software which 'hooked' the INT 19 vector did not return control to the BIOS. | 4 |
| "Returned INT 19h" | BIOS Received control back from prior INT19h invocation. | 4 |
| • | If the called code is not TCPA-aware it may have loaded additional unmeasured code. However there is a log entry showing entry to (and measurement of) untrusted code. | |
| "Return via INT 18h" | BIOS Received control back via INT 18h | 4 |
| | If the called code is not TCPA-aware it may have loaded additional unmeasured code. However there is a log entry showing entry to (and measurement of) untrusted code. | |
| "Booting BCV Device s" | BIOS is IPL/Booting a BCV Device. | 4 |
| | The value 's' is a ASCII string that unambiguous describes the boot device. This SHOULD include an indication of logical or physical device location and any ID string returned by the device. | |
| "Booting BEV Device s" | BIOS is IPL/Booting a BEV Device. | 4 |
| | The value 's' is an ASCII string supplied by the BEV device. | |
| "Entering ROM Based Setup" | BIOS is entering ROM based Setup during pre- boot environment. | 0 |
| "Booting to Parties N" | BIOS is IPL/Booting from a Parties Partition #N. | 4 |
| | The value n is the actual numeric value of the partition number represented as a printable ASCII hex value. (e.g. partition zero would get the string value "0"). Where N is the index into the BEER table. | |
| "User Password Entered" | User has entered the correct user password. | 4 |
| "Administrator Password Entered" | User has entered the correct administrator password. | 4 |
| "Password Failure" | The typed password did not match the stored password after a specified number of retries. | 4 |

7-

| "Wake Event n" | Cause of the power to be applied to the platform where n is the WfM wake source (e.g. wake source zero would get the string value "0"). | 1 |
|--|---|---|
| "Boot-Sequence User Intervention" | User altered the boot sequence | |
| "Chassis Intrusion" | The case was opened. | 1 |
| "Non Fatal Error" | A non-fatal POST error (e.g. keyboard failure) was encountered. This is any error that allows the system to continue the boot process | 1 |
| "Start Option ROM Scan" | BIOS has started the Option ROM scan. | 2 |
| "Unhiding Option ROM Code" | Unhiding Option ROM Code | 2 |
| " <oprom non-ipl<br="" specific="">String>"</oprom> | An Option ROM vendor specific string for non-Boot/IPL events. | 3 |
| " <oprom ipl="" specific="" string="">"</oprom> | An Option ROM vendor specific string for Boot/IPL events. | 5 |

8. Implem ntation

Seni vinidancida comuni. The ICIA regulars with decision for opening and IOIA Appleation treaters. IICA becker Drug lifetius and a set of ACII observe distribus contribute for Exon Log. A degree of these business of their relationship is to Figure 18. The distribute below. End of bilanceties comments

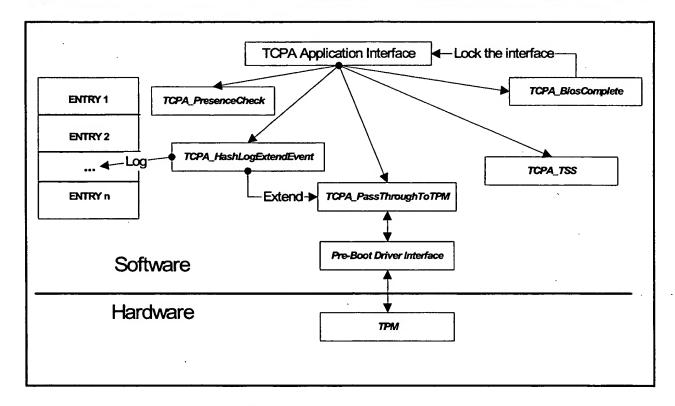

Figure 8-1 Pre-Boot Interfaces

8.1 Application Level Interface

Entering this interface the CPU MUST be in either real-mode or big-real-mode, and the gate A20 state is undefined. Upon exit the interface and gate A20 state MUST return in the same mode.

This interface only supports up to 4GB of physical address space.

8.1.1 General Calling Convention

Each function below will have the following general calling convention:

On entry:

(AH) = BBh

(AL) = Function selector, see below

(ES) = Segment portion of the pointer to the input parameter block

(DI) = Offset portion of the pointer to the input parameter block

(DS) = Segment portion of the pointer to the output parameter block

(SI) = Offset portion of the pointer to the output parameter block

(EBX) = 'TCPA' (41504354h)

(ECX) = 0

(EDX) = 0

On return:

(EAX) = Return code. If (AH) = 86h the function is not supported by the system.

(DS:SI) = Modified based on specific function called

All other register contents including upper words of 32-bit registers are preserved. Note that this cannot be guaranteed if (AH) = 86h because the call could be made on a pre-TCPA BIOS.

8.1.2 Return C des

The following are the defined error codes th pre-Boot functions MAY return:

| Retum Code TCPA_PC_OK | Value 0000h | Description The function returned successful. |
|--------------------------|---|--|
| TCPA_PC_TPMERROR | TCPA_PC_OK + 01h (TPM driver error << 16) | The TPM driver returned an error. The upper 16 bits contain the actual error code returned by the driver as defined in Section 8.2.3.6 Error and Return Codes. |
| TCPA_PC_LOGOVERFLOW | TCPA_PC_OK + 02h | There is insufficient memory to create the log entry. |
| TCPA_PC_UNSUPPORTED | TCPA_PC_OK + 03h | The requested function is not supported. |

8.1.3 TCPA_StatusCh ck

INT 1Ah (AH)=BBh, (AL)=00h

This function call verifies the presence of the TCPA BIOS interface and provides the caller with the version of TCPA BIOS Specification to which the implementation complies. If required, MPInitTPM MAY be called to initialize the MP Driver during the first invocation of this function..

On entry:

(AH) = BBh

(AL) = 00h

On return:

(EAX) = Return code. Set to 00000000h if the system supports the TCPA BIOS calls.

(EBX) = 'TCPA' (41504354h)

(CH) = TCPA BIOS Major Version (01h for version 1.0)

(CL) = TCPA BIOS Minor Version (00h for version 1.0)

(EDX) = BIOS TCPA Feature Flags

(ESI) = Pointer to the Event Log

Note:

The caller must assume that no registers are preserved by the call, since the call might be made in an unsupported system environment.

8.1.4 TCPA_HashLogExtendEv nt

INT 1Ah, (AH)=BBh, (AL)=01h

This function performs the functions of the: TSS_HashAll, TPM_Extend, and TSS_LogEvent operation for the data region specified by the caller. The caller should verify the availability of this function by issuing a previous call to the Presence Check function, that way the caller can be assured that calls to this function preserve the register contents (including the upper 16 bits of 32-bit registers).

On entry:

(AH) = BBh

(AL) = 01h

(ES) = Segment portion of the pointer to the HashLogExtendEvent input parameter block

(DI) = Offset portion of the pointer to the HashLogExtendEvent input parameter block

(DS) = Segment portion of the pointer to the HashLogExtendEvent output parameter block

(SI) = Offset portion of the pointer to the HashLogExtendEvent output parameter block

(EBX) = 'TCPA' (41504354h)

(ECX) = 0

(EDX) = 0

On return:

(EAX) = TCPA_STATUS

(DS:SI) = Referenced buffer updated to provide return results.

All other registers are preserved.

8.1.4.1 HashLogExtendEvent Input Parameter Block

| Oiisei. | Size : | Field Name 👙 🤾 | Description |
|---------|--------|----------------|---|
| 00h | WORD | IPBLength | The length, in bytes of the input parameter block, set a minimum of 0018h |
| 02h | WORD | Reserved | Reserved for future definition by this specification, set to 0000h. |
| 04h | DWORD | HashDataPtr | The 32-bit physical address of the start of the data buffer to be hashed, extended, and logged. |
| 08h | DWORD | HashDataLen | The length, in bytes, of the buffer referenced by HashDataPtr. |
| 0Ch | DWORD | PCRIndex | The PCR number to which the hashed result is to be extended. |
| 14h | DWORD | LogDataPtr | The 32-bit physical address of the start of the data buffer containing the TCPA_PCR_EVENT data structure. |
| 18h | DWORD | LogDataLen | The length, in bytes, of the TCPA_PCR_EVENT data |

| Offset Size | Field Name | Description | |
|-------------|------------|-------------|--|
| | | structure. | |

HashLogExtendEvent Output Parameter Block

| Offset | Size | Field Name | Description |
|--------|-------------|-------------|--|
| 00h | WORD | OPBLength | The length, in bytes, of the output parameter block, a minimum of 0048h. |
| 02h | WORD | Reserved | Reserved for future definition by this specification, set to 0000h. |
| 04h | DWORD | EventNumber | The event number of the event just logged. |
| 08h | 20 BYTEs | HashValue | The TCPA_HASH result of the HashAll function. |

8.1.5 TCPA_PassThroughToTPM

INT 1Ah, (AH)=BBh, (AL)=02h

This function provides a pass-through capability from the caller to the system's TPM. Refer to the TPM implementation appendix of the Main TCPA Specification for input/output parameter block formats. The caller should verify the availability of this function by issuing a previous call to the Presence Check function, that way the caller can be assured that calls to this function preserve the register contents (including the upper 16 bits of 32-bit registers).

The TPM in and out Operands are defined in the Main Specification.

On entry:

(AH) = BBh(AL) = 02h

(ES) = Segment portion of the pointer to the TPM input parameter block

(DI) = Offset portion of the pointer to the TPM input parameter block

(DS) = Segment portion of the pointer to the TPM output parameter block

(SI) = Offset portion of the pointer to the TPM output parameter block

(EBX) = 'TCPA' (41504354h)

(ECX) = 0(EDX) = 0

On return:

(EAX) = TCPA_STATUS

(DS:SI) = Referenced buffer updated to provide return results.

All other registers are preserved.

8.1.5.1 TPM Input Parameter Block

| Qiisot | Steet : | Field Name | Description |
|--------|---------|--------------|--|
| 00h | WORD | IPBLength | The length, in bytes of the input parameter block, set a minimum of 008h |
| 02h | WORD | Reserved | Reserved for future definition by this specification, set to 0000h. |
| 04h | WORD | OPBLength | Size of TPM Output Parameter Block allocated |
| 06h | WORD | Reserved | |
| 08h | BYTE | TPMOperandIn | The TPM Operand Parameter Block to send to the TPM |

TPM Output Parameter Block 8.1.5.2

| Oiisel | Size- | Field Name | Description |
|--------|-------|---------------|--|
| 00h | WORD | OPBLength | The length, in bytes, of the output parameter block, a minimum of 0004h. |
| 02h | WORD | Reserved | Reserved for future definition by this specification, set to 0000h. |
| 04h | BYTE | TPMOperandOut | The TPM Operand Parameter Block received from the TPM |

8.1.6 TCPA_ShutdownPreBootInterface

INT 1Ah, (AH)=BBh, (AL)=03h

The IPL Code issues this call once it has its runtime access to the TPM available, and causes the system firmware to no longer respond to TCPA BIOS requests through this interface until the next system restart.

Calling this function is optional.

On entry:

(AH) = BBh

(AL) = 03h

(EBX) = 'TCPA' (41504354h)

On return:

(EAX) = TCPA_STATUS

All other registers are preserved.

8.1.7 TCPA_LogEvent

INT 1Ah, (AH)=BBh, (AL)=04h

This function MUST provide the TSS capability TSS_LogEvent.

On entry:

(AH) = BBh

(AL) = 04h

(ES) = Segment portion of the pointer to the LogEvent input parameter block.

(DI) = Offset portion of the pointer to the LogEvent input parameter block.

(DS) = Segment portion of the pointer to the LogEvent output parameter block

(SI) = Offset portion of the pointer to the LogEvent output parameter block

(EBX) = 'TCPA' (41504354h)

(ECX) = 0

(EDX) = 0

On return:

(EAX) = TCPA_STATUS

(DS:SI) =

All other registers are preserved.

8.1.7.1 LogEvent Input Parameter Block

| Olisel | Sizo 💎 | | Description : |
|--------|--------|--------------|--|
| 00h | WORD | IPBLength | The length, in bytes of the input parameter block, set to 001Ch |
| 02h | WORD | Reserved | Reserved for future definition by this specification, set to 0000h. |
| 04h | DWORD | HashDataPtr | The 32-bit physical address of the start of the data buffer to be logged. |
| 08h | DWORD | HashDataLen | The length, in bytes, of the buffer referenced by HashDataPtr. |
| 0Ch | DWORD | PCRIndex | The PCR number to which the event is the logged. |
| 10h | DWORD | LogEventType | The EventType code to be logged with the resultant hash, as defined by the TCPA Trusted Subsystem Specification. |
| 14h | DWORD | LogDataPtr | The 32-bit physical address of the start of the data buffer containing the TCPA_PCR_EVENT data structure. |
| 18h | DWORD | LogDataLen | The length, in bytes, of the TCPA_PCR_EVENT data structure. |

8.1.7.2 LogEv nt Output Parameter Block

| | Size | Field Name | Description |
|-----|-------|-------------|---|
| 00h | WORD | OPBLength | The length, in bytes, of the output parameter block, set to 000Ch. |
| 02h | WORD | Reserved | Reserved for future definition by this specification, set to 0000h. |
| 04h | DWORD | EventNumber | The event number of the event just logged. |

8.1.8 TCPA_HashAll

INT 1Ah, (AH)=BBh, (AL)=05h

This function MUST provide the TSS capability: TSS_HashAll.

On entry:

(AH) = BBh(AL) = 05h

(ES) = Segment portion of the pointer to the HashAll input parameter block

(DI) = Offset portion of the pointer to the HashAll input parameter block

(DS) = Segment portion of the pointer to the Digest

(SI) = Offset portion of the pointer to the Digest

(EBX) = 'TCPA' (41504354h)

(ECX) = 0

(EDX) = 0

On return:

(EAX) = TCPA_STATUS

(DS:SI) = Referenced buffer updated to provide return results.

All other registers are preserved.

8.1.8.1 HashAll Input Parameter Block

| | Sizo : | Field Name | Description |
|-----|--------|-------------|---|
| 00h | WORD | IPBLength | The length, in bytes of the input parameter block, set to 0010h |
| 02h | WORD | Reserved | Reserved for future definition by this specification, set to 0000h. |
| 04h | DWORD | HashDataPtr | The 32-bit physical address of the start of the data buffer to be hashed. |
| 08h | DWORD | HashDataLen | The length, in bytes, of the buffer referenced by HashDataPtr. |
| 0Ch | DWORD | AlgorithmID | The algorithm to use. In TCPA v1, this MUST be TCPA_ALG_SHA. |

8.1.9 TCPA_TSS

INT 1Ah, (AH)=BBh, (AL)=06h

This function provides optional TSS capabilities. If any TSS commands are implemented through this function TSS_GetCapability MUST be implemented to give the caller the ability to determine which TSS Operations are supported. If no TSS Operations are supported this function MUST return with TCAP_STATUS = TCPA_PC_UNSUPPORTED.

The TSS in and out Operands are defined in the TSS Specification.

On entry:

(AH) = BBh

(AL) = 06h

(ES) = Segment portion of the pointer to the TSS input parameter block

(DI) = Offset portion of the pointer to the TSS input parameter block

(DS) = Segment portion of the pointer to the TSS output parameter block

(SI) = Offset portion of the pointer to the TSS output parameter block

(EBX) = 'TCPA' (41504354h)

(ECX) = 0

(EDX) = 0

On return:

(EAX) = TCPA_STATUS

(DS:SI) = Referenced buffer updated to provide return results.

All other registers are preserved.

8.1.9.1 TSS Input Parameter Block

| | Stze ; | Field Name. | Description |
|-----|--------|--------------|--|
| 00h | WORD | IPBLength | The length, in bytes of the input parameter block, set a minimum of 008h |
| 02h | WORD | Reserved | Reserved for future definition by this specification, set to 0000h. |
| 04h | WORD | OPBLength | Size of TSS Output Parameter Block allocated |
| 06h | WORD | Reserved | |
| 08h | BYTE | TSSOperandIn | The TSS Operand Parameter Block to send to the TPM |

8.1.9.2 TSS Output Parameter Block

| Oliteel (| Size | Field Name | Description |
|-----------|------|------------|--|
| 00h | WORD | OPBLength | The length, in bytes, of the output parameter block, a minimum of 0004h. |

| Offset | Size | (Field Name | Description |
|--------|------|---------------|---|
| 02h | WORD | Reserved | Reserved for future definition by this specification, set to 0000h. |
| 04h | BYTE | TSSOperandOut | The TSS Operand Parameter Block received from the TSS |

8.1.10 TCPA_BIOSReserved

INT 1Ah, (AH)=BBh, (AL)=07h to 07Fh

Remaining sub-functions in the range 07h to 07Fh are reserved for future definition by this specification.

8.1.11 TCPA_BIOSVendorRes rved

INT 1Ah, (AH)=BBh, (AL)=80h to 0FFh

Reserved for Vendor specific functions.

On entry:

(AH) = BBh

(AL) = nnh

(EBX) = 'TCPA' (41504354h)

8.2 TPM Driv r Int rfaces

8.2.1 Module Architectures

8.2.1.1 TPM Supplied BIOS Drivers

lind of internative evanuett.

8.2.1.2 Object Format of BIOS Drivers

Both drivers provide a standard object format to the BIOS vendor as described in this section.

The table below describes what the header of the BIOS drivers will look like and where the driver code should start. The BIOS will move the driver into high memory, and then call the start code of the driver. The driver code MUST be relocate-able and MUST be 32-bit code, capable of running in a flat segment memory model.

BIOS Driver Header

| Offset | Size | Default-Value | Description |
|--------|----------|---------------|---|
| 00h | WORD | 55AAh | Signature used to designate the start of the BIOS driver. This is deliberately set different than the Option ROM header. |
| 02h | DWORD | | Pointer to beginning of code (Offset to entry point for the driver). |
| 06h | WORD | | Total size of the driver in bytes (including the header). |
| 08h | DWORD | 0000000h | Base address of the TPM (as set by BIOS). |
| 0Ch | DWORD | 00000000h | Optional 2 nd base address. This is for memory and I/O mapped or decoding I/O location/address (as set by BIOS). |
| 10h | BYTE | FFh | IRQ Level (00h is not assigned FFh is not required) (as set by BIOS and MUST be sharable). |
| 11h | BYTE | FFh | DMA Channel (FFh in none assigned) (as set by BIOS). |
| 12h | BYTE | | XOR-Checksum of entire driver including this header at driver builds time. This is not maintained by the BIOS. |
| 13h | BYTE | 00h | Reserved and set to zero. |
| 14h | DWORD | 00000000h | PCI PFA if appropriate. |
| 18h | DWORD | 0000000h | USB, CardBus, etc |
| 1Ch | DWORD | 00000000h | Reserved and set to zero. |
| 20h | Variable | | Reserved for vendor specific data or is the entry point if vendor specific data not used. |

| XXh | Entry point into driver. | |
|-----|--------------------------|--|
| | | |

8.2.1.3 Basic assumptions for both BIOS Drivers

8.2.1.3.1 **CMOSTimer**

The CMOS Real: Time Clock (RTC) will be available for both drivers and initialized by the caller. The RTC will be available by its legacy I/O addresses.

8.2.1.3.2 Motherboard Initialization

All Motherboard chipset initialization (concerning the communication channel to TPM device) will be completed by the CRTM or POST-BIOS prior to calling the BIOS -CRTM-Driver or POST-Driver.

8.2.1.3.3 Basic requirements

The BIOS drivers MUST fulfill the following requirements:

- The drivers MUST be completely self-contained since no BIOS services should be used;
- The drivers MUST check the validity of all the input parameters;
- The drivers MUST include block chaining for the transmission of large data blocks to and from the TPM device;
- The drivers are responsible to add and remove all TPM-Vendor specific protocol information to the TCPA-Transfer-Data (TCPA-Command);

8.2.2 M mory Abs nt (MA) Driver

8.2.2.1 MA Driver Limitations

- No DMA
- No IRQ
- No Physical Memory
- MA-Driver Register usage table (General-Purpose and Segment register):

| Register | Size | In / Out | Description |
|----------|------|---------------|---|
| EAX | 32 | Not available | Driver must preserve this register. |
| EBX | 32 | Not available | Driver must preserve this register. |
| ECX | 32 | In / Out | Driver I/O; Set by the caller. |
| EDX | 32 | In / Out | Driver I/O; Set by the caller. |
| ESI | 32 | Not available | Driver must preserve this register. |
| EDI | 32 | Not available | Driver must preserve this register. |
| ESP | 32 | In (Offset) | Offset of the pointer to argument packet see Section 8.2.2.2. Set by the caller. |
| SS | 16 | In (Segment) | Segment of the pointer to argument packet see Section 8.2.2.2. Set by the caller. |

- All other registers MAY be used as working registers by the MA driver without preserving them.
- The IA-32 processor (PIII, Athlon or equivalent processor) architecture supports MMX/ 3DNow and FPU. It MAY be negotiated between the BIOS vendor (more specifically the vendor of the Core RTM) and the supplier of the Core-RTM-Driver (typically the TPM vendor) that this Driver can use the MMX/3DNow register MM0 through MM7 as working registers. (Note: The MMX registers are mapped to the physical location of the floating-point registers (R0 through R7). This means when a value is written into an MMX register using an MMX instruction, the value also appears in the corresponding floating-point register.)

Trademarks

- AMD, the AMD logo, AMD Athlon, K6, 3DNow!, and combinations thereof, and K86 are trademarks, and AMD-K6 is a registered trademarks of Advanced Micro Devices, Inc.
- Microsoft is a registered trademark of Microsoft Corporation.
- MMX is a trademark and Pentium is a registered trademark of Intel Corporation.
- Other product names used in this publication are for identification purposes only and may be trademarks of their respective companies.

8.2.2.2 MA Driver Argument Packet Structure

On entry to the MA driver, SS:ESP points to an instance of this structure. The CRTM MAY have one or more of these structures per function to allow multiple calls into a single function from different locations.

MADriverArgPacketStruct STRUC

ReturnAddr DD ? ; [IN] Return address. Allows driver to retrun via RET.

HeaderPtr DD ? ; [IN] Pointer to the BIOS Driver Header (Reference 8.2.1.2).

FunctionNum DB ? ; [IN] Punction number identifing the function to perform.

MADriverArgPacketStruct ENDS

8.2.2.3 Parameters and Structures

8.2.2.3.1 Parameter pblnBuf

| BYTE TODINBUT | |
|---------------|---|
| Description | Pointer to start address of the input data for the data transfers to TPM. |

8.2.2.3.2 Parameter dwinPCRLen

| DWORD dwinkGRLen | |
|------------------|--|
| Description | Upper 16 bits contains the PCRIndex. The lower 16 bits contain the length of |
| | the input data record - 1. (i.e., FFFFh hashes 65536 bytes.) |

8.2.2.3.3 Parameter bMAInitTPMFctld

| BYTE BMAINITPME | CONTRACTOR OF THE PROPERTY OF |
|-----------------|---|
| Description | Selects the TPM-Operation for the CRTM-Driver initialization. |
| | 00h= No TPM-Operation is selected. |
| | To activate the TPM_Startup command set this parameter with a |
| | TCPA_STARTUP_TYPE identifier specified in the Main Specification (see TPM_Startup section in Main Specification). |

8.2.2.3.4 Parameter bMAPhyPresenceTPMCmdId

| BYTIE bMAPhyPresend | seTPMCmdId |
|---------------------|---|
| Description | Selects the TPM-Operation for the Physical Presence command. |
| | |
| | This value is used in the TPM-Param-Block of the TPM_PhysicalPresence |
| 1 | command. For the detailed definition of this identifier please use the Main |
| | Specification. |

8.2.2.4 MA Driver Functions

8.2.2.5 MA Driver Function Int rfac

The function number is contained in the FunctionNum field of the MADriverArgPacketStruct structure (Reference Section 8.2.2.2). The base for the function numbers is **01h**. The offset for vendor specific driver function numbers is 80h. All functions return their exit code in the DL Register.

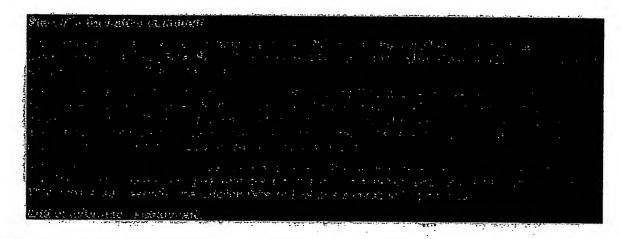

8.2.2.5.1 Function MAInitTPM (Function Number: 01h)

The first call to the MA Driver must execute this function. This function does the initialization of the TPM and establishes and verifies the communication (with the parameters from the header) between the MA Driver and the TPM. If a TPM Operation is selected by the bTPMInitCRTMFctId parameter this function will send the command string to the TPM.

A TPM device can be opened with the same address only once by one host at a time. If the requested access cannot be granted (e.g., invalid input parameter) or if opening the connection to the TPM ends unsuccessfully, the function returns corresponding *errorCode*.

8.2.3 Mem ry Present (MP) Driver

8.2.3.1 Architecture

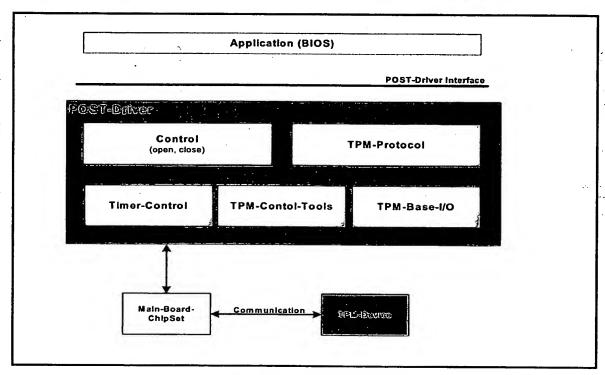

Figure - 7.1 Pre-Boot Driver Interface

8.2.3.2 MP Driv r Limitations

- No Interrupts are allowed. The MP driver MUST poll the TPM.
- The MP driver MAY be relocated after MAInitTPM and at any time between call MP driver functions.
- MP Driver needs to be placed into ACPI non-reclaimable area. The driver MUST support being relocated between calls.
- The resources allocated to the TPM MAY be changed by the BIOS between calling MP driver functions, therefore, the MAInitTPM function MUST be recallable.
- All registers not used for return parameters MUST be preserved.
- MP Driver needs to be built such that it has any data memory it requires is part of the body of the driver image.

8.2.3.3 Parameters and Structures

8.2.3.3.1 Parameter pbinBuf

| BYVE PadhBuf | |
|--------------|--|
| Description | Pointer to input data for the data transfers to TPM. |

8.2.3.3.2 Parameter pbOutBuf

```
TPMTransmitEntryStruct STRUC

pbInBuf DD ? ; [IN] Pointer to input data for the data transfers to TPM.

dwInLen DD ? ; [IN] Length of the input data record.

pbOutBuf DD 0 ; [OUT] Pointer to output buffer for the data from the TPM.

dwOutLen DD 0 ; [IN/OUT] DWORD to store the length info of the output data record.

TPMTransmitEntryStruct ENDS
```

The parameter pdwOutLen is both an input and output parameter:

As input (entry point of this function) it specifies the maximum number of bytes, which can be read from the TPM device to the output buffer. If the function terminates successfully the value of this variable is adjusted to match with the number of bytes received from the TPM.

8.2.3.3.6 Parameter IpTPMTransInfo

| TIPMINEDSMITTATIONS INVESTIGATION | DIPMinensinfo |
|-----------------------------------|---|
| Description | Pointer to a TPMTransmitEntryStruct, which carries the input and output |
| | parameters for data transfer between host system and TPM device. |

8.2.3.4 MP Driver function interfac

The AL-Register contains the function selector number for the different functions of this driver (the base for this is **01h**). The offset for vendor specific driver function numbers is 80h. All these functions returns there exit code in AL-Register.

8.2.3.4.1 Function MPInitTPM (Function-Nr-AL-Register: 01h)

This function is performed the first time the driver is called. It is used to initialize the TPM if not already done by the BIOS Boot Block or if there are some differences between the communication parameters for the CRTM and POST-Phase. This function must be also called if the BIOS moves the I/O address used by the TPM (such as if BIOS performs PnP conflict resolution).

This function does the initialization of the TPM and the driver and establishes (opens a connection) and verifies the communication (with the parameters from the header) between the POST-Driver and the TPM. If the interrupt number is set to FFh no interrupts are generated. This means the interrupts are disabled in the TPM device and the communication runs in polling mode this is the default mode.

A TPM device can be opened with the same address only once by one host at a time. If the requested access cannot be granted (e. g. invalid input parameter) or if opening the connection to the TPM ends unsuccessfully, the function returns corresponding *errorCode*.

| Input Parameters | All necessary Inputs are located in the driver header structure (see 8.2.1.2). | |
|-------------------|--|--|
| Output Parameters | None | |
| Return Value | AL = return value of this function | |
| | One of the following values: | |
| | TPM_OK | |
| | TPM_INVALID_ADR_REQUEST | |
| | TPM_IS_LOOKED | |
| | TPM_INVALID_DEVICE_ID | |
| | TPM_INVALID_VENDOR_ID | |
| | TPM_RESERVED_REG_INVALID | |
| | TPM_FIRMWARE_ERROR | |
| | TPM_UNABLE_TO_OPEN | |
| | TPM_GENERAL_ERROR | |

8.2.3.4.2 Functi n MPCI seTPM (Function-Nr-AL-Register: 02h)

Closes a connection to a TPM device with the specified parameters in the header. All data related to this connection to the device, such as allocated memory, are released. The registers in the configuration space of the TPM device are reinitialized to the reset status and the logical device is deactivated.

If the specified parameters in the header are not valid, or if closing of the connection to the TPM ends unsuccessfully, the function fails and returns corresponding *errorCode*.

| EYTE MPC LOSGITAM | | |
|-------------------|--|--|
| (Kelel): | | |
| Input Parameters | All necessary inputs are located in the driver header structure (see 8.2.1.2). | |
| Output Parameters | None | |
| Return Value | AL = return value of this function | |
| | One of the following values: | |
| | TPM_OK | |
| | TPM_INVALID_ADR_REQUEST | |
| | TPM_UNABLE_TO_CLOSE | |
| | TPM_GENERAL_ERROR | |

8.2.3.4.3 Function MPGetTPMStatusInf (Function-Nr-AL-Register: 03h)

This function reads the current error and status information from the TPM device. All data related to this connection, such as allocated memory, are still valid.

If the specified parameters in the header are not valid, or this device is not yet open, the function fails and returns an error flag.

| DWORD MFCETIPMSET | onler | |
|---|---|--|
| Input Parameters All necessary inputs are located in the driver header structure (see 8.2.1.2). | | |
| Output Parameters | None | |
| Return Value | EAX = return value of this function | |
| | For the coding of the return value see 8.2.3.5. | |

8.2.3.4.4 Functi n MPTPMTransmit (Functi n-Nr-AL-Register: 04h)

Transmits the data from the input buffer (*pblnBuf) to the TPM and reads the response from the TPM to the output buffer (*pbOutBuf). After successful Power-On and opening a TPM connection, the host can send the first request to the TPM by writing the bytes to the TPM. When the request is processed by the TPM and the response is available the TPM firmware issues an interrupt (or polling by the host if the interrupt is disabled) and the host can read it.

This function is responsible for block chaining and error handling during the interaction with the TPM device over communication interface.

All vendor specific transport protocol information are added and removed by this function. The input and output buffer contains only TCPA-Command-Param-Lists, this data streams are opaque to this function. This means that the TCPA-Command-Param-Lists in these buffers will be not interpreted or reorganized by this function.

If no open connection to a TPM device is available, if it returns no response, if the function calling parameters are invalid, or the transmission of the data block to the TPM ends unsuccessfully, the function fails and returns corresponding *errorCode*.

| | and the first control of the control |
|--------------------------|--|
| Byvewynaneni Wprenian | anilanis/Streat Jouphingialog |
| Input Parameters | ESI = pointer to a TPMTransmitEntryStruct (see 8.2.3.3.5). |
| | pblnBuf Pointer to the input buffer containing the data (TCPA command string) for the TPM device (see 8.2.3.3.1). |
| | dwlnLen Length of the input buffer data (see 8.2.3.3.3). |
| Input/Output Parameters | |
| | Pointer to store the length info of the received data (see 8.2.3.3.4). It also carries the size (input) of the OutBuf to store the response of the TPM device. |
| Output Parameters | pbOutBuf Pointer to the output buffer to store the data from the TPM device (see 8.2.3.3.2). |
| Return Value | AL = return value of this function One of the following values: TPM_OK TPM_IS_LOCKED TPM_NO_RESPONSE TPM_INVALID_RESPONSE TPM_RESPONSE_TIMEOUT TPM_INVALID_ACCESS_REQUEST TPM_FIRMWARE_ERROR TPM_GENERAL_ERROR TPM_TRANSFER_ABORT |

8.2.3.5 Return-Values for MPGetTPMStatusInfo (Function: 03h)

If the return value is **zero** no error condition is active for this TPM connection. This status is the OK-Status of the TPM device.

| DWOR | D-Refrain-Value | |
|----------|--|--|
| Bit | Descriptions | |
| 0 | If set a general error condition is active for this TPM connection. For details evaluate the condition | |
| | of the following error information (Bit 1:15). | |
| 1 | Invalid status/error request access. | |
| 2 | If set a general firmware error occurred during start up of the TPM firmware. | |
| 3 | Time out occurred during send process of the request sequence to the TPM device. | |
| 4 | Response time out in TPM communication. | |
| 5 | Transfer communication abort with the TPM device. | |
| 6 | Reserved. This bit is read-only and has a value of 0. | |
| 7 | Reserved. This bit is read-only and has a value of 0. | |

8.2.3.6 Error and Return C des

The base number for the return codes is **TPM_RET_BASE = 01h**. The catalog of error and return codes can be extended to include TPM vendor specific return codes at the end of this list.

If either driver fails to communicate with the TPM it MUST do one of the following:

- Permanently disable the connection to the TPM,
- Take action to prevent the platform from loading the Operating System,
- Perform a Platform Reset, or
- Force transfer control of the platform to a manufacturer approved environment.

| (වින්තර් Code | Value Value | Description |
|----------------------------|--------------------|---|
| IPM_UK | 00h | Indicator of successful execution of the function. |
| TPM_GENERAL_ERROR | TPM_RET_BASE + 00 | A general unidentified error occurred. |
| TPM_IS_LOCKED | TPM RET BASE + 01 | The access cannot be granted the device is open. |
| TPM_NO_RESPONSE | TPM RET BASE + 02 | No response from the TPM device. |
| TPM_INVALID_RESPONSE | TPM RET BASE + 03 | The response from the TPM was invalid. |
| TRM_INVALID_ACCESS_REQUEST | TEM-RET-BASE + 04 | The access parameters for this function are invalid. |
| TPM_FIRMWARE_ERROR | TPM RET BASE + 05 | Firmware error during start up. |
| TPM_INTEGRITY_CHECK_FAILED | TPM RET BASE + 06 | Integrity checks of TPM parameter failed. |
| TPM_INVALID_DEVICE_ID | TPM RET BASE + 07 | The device ID for the TPM is invalid. |
| TPM_INVALID_VENDOR_ID | TPM RET BASE + 08 | The vendor ID for the TPM is invalid. |
| TPM_UNABLE_TO_OPEN | TPM RET BASE + 09 | Unable to open a connection to the TPM device. |
| TPM_UNABLE_TO_CLOSE | TPM RET BASE + 10 | Unable to close a connection to the TPM device. |
| TPM_RESPONSE_TIMEOUT | TPM RET BASE + 11 | Time out for TPM response. |
| TRM_INVALID_COM_REQUEST | TPM RET BASE + 12 | The parameters for the communication access are invalid. |
| TPM_INVALID_ADR_REQUEST | TPM_RET_BASE + 13 | The address parameter for the access is invalid. |
| TPM_WRITE_BYTE_ERROR | TPM RET BASE + 14 | Bytes write error on the interface. |
| TPM_READ_BYTE_ERROR | TPM RET BASE + 15 | Bytes read error on the interface. |
| TPM_BLOCK_WRITE_TIMEOUT | TPM RET BASE + 16 | Blocks write error on the interface. |
| TPM_CHAR_WRITE_TIMEOUT | TPM RET BASE + 17 | Bytes write time out on the interface. |
| TPM_CHAR_READ_TIMEOUT | TPM RET BASE + 18 | Bytes read time out on the interface. |
| TPM_BLOCK_READ_TIMEOUT | TPM RET BASE + 19 | Blocks read error on the interface. |
| TPM_TRANSFER_ABORT | TPM RET BASE + 20 | Transfer abort in communication with TPM device. |
| TPM_INVALID_DRY_FUNCTION | TPM RET BASE + 21 | Function number (AL-Register) invalid for this driver. |
| TPM_OUTPUT_BUREER TO SHORT | TRM_RET_BASE + 224 | Output buffer for the TRM response to short. |
| TPM_FATAL_COM_ERROR | TPM_RET_BASE + 23 | Fatal error in TPM communication. |
| TPM_INVALID_INPUT_PARA | TPM RET BASE + 24 | Input parameter for the function invalid. |
| TPM_TCPA_COMMAND_ERROR | TPM_RET_BASE + 25 | Error during execution of a TCPA command. |
| | | g troud of a for A committed. |
| | | |
| | | |
| | | |
| TPM_VENDOR_BASE RET | 128 | Start point for roturn godes are recovered to |
| _ : _ : : = : : _ : | | Start point for return codes are reserved for use by TPM vendors. |
| | | Tonaura. |

Frances and another to end

The Motherboard MAY provide a mechanism that provides proof of a human's physical presence to the Platform.

8.3.1 Physical Switch

A physical switch or jumper or momentary button that when activated provides a Physical Presence signal to the TPM. It MUST NOT be possible to generate this signal from software. This switch, jumper, or button MUST be in a location typically inaccessible to the user during the normal operation of the platform. Example: A DIP switch connected to the Motherboard which is within the platform case.

8.3.2 Indication of Physical Presence from the CRTM

The CRTM MAY be designed to detect the user's physical presence and use the TSC_PhysicalPresence operation to indicate physical presence to the TPM. If a utility external to the CRTM is predicated upon an indication of physical presence, it MUST be designed such that it can only be executed if the user is physically present at the platform (e.g., insertion of a floppy disk, USB device, pressing a button) The CRTM MUST perform one of the two following sequences based on the indication of physical presence:

- Physical Presence NOT indicated: Exit normally, processing the remaining portions of the pre-boot environment.
 - In this option, prior to exiting the CRTM, it MUST set the physicalPresenceMask flag appropriate to the design of the platform. If physicalPresenceMask is TRUE, the CRTM MUST set the PhysicallyPresent to FALSE and PhysicalPresenceLock to TRUE.
- Physical Presence IS indicated: Transfer control of the platform to the utility that requires physical presence.

Prior to transferring control of the platform to the utility that requires physical presence, the CRTM MAY leave the PhysicalPresenceMask, PhysicallyPresent, and, the PhysicalPresenceLock flags in any state appropriate for the design of the platform and entry into the utility. However, upon exit from the utility, it MUST set the physicalPresenceMask flag appropriate to the design of the platform. If physicalPresenceMask is TRUE, the CRTM MUST set the PhysicallyPresent to FALSE and PhysicalPresenceLock to TRUE.
